About CDI | CDI & electrosorption

Capacitive deionization (CDI) is a technology to deionize water by applying an electrical potential difference over two electrodes. The electrodes can have different chemistries and, for instance, contain intercalation host compounds, or are synthesized of porous carbon particles. [Capacitive deionization \(CDI\) for desalination and water ...](#)

Capacitive deionization (CDI) has attracted the interest of the community investigating water treatment technologies since the mid-1960s. The technology is based on the recognition that high-surface-area electrodes, when electrically charged, can quantitatively adsorb ionic components from water, thereby resulting in desalination.
