MINIMAL RESIDUAL DISEASE IN ACUTE LYMPHOBLASTIC LEUKEMIA

In patients with acute lymphoblastic leukemia (ALL), monitoring of minimal residual disease (MRD) offers a way to precisely assess early treatment response and detect relapse. Established methods to study MRD are flow cytometric detection of abnormal immunophenotypes, polymerase chain reaction (PCR)

Minimal residual disease - Wikipedia

Minimal residual disease (MRD) is the name given to small numbers of leukaemic cells (cancer cells from the bone marrow) that remain in the person during treatment, or after treatment when the patient is in remission (no symptoms or signs of disease).

the major clinical studies evaluating minimal residual disease in acute myeloid leukemia in adults in recent years and address the technical and practical issues still hampering the spread of these techniques outside controlled clinical trials.

Minimal Residual Disease In Acute Myeloid Leukemia

This ability to measure minimal residual disease (MRD) in AML was not available in 1956 when criteria for the evaluation of response to treatment in acute leukemia were proposed⁹ and so understandably thresholds were set based on the technology available at that time (Table 1).

Minimal residual disease - an overview | ScienceDirect Topics

Minimal residual disease refers to submicroscopic disease,

i.e., disease that remains occult within the patient but eventually leads to relapse. A patient's response to treatment for acute leukaemia is influenced by many factors (Box 4.4).

Minimal Residual Disease in AML - The ASCO Post
Many hematologist-oncologists are still not using minimal residual disease testing, even in diseases such as acute lymphoid leukemia (ALL), where it is well established as the most important predictor of relapse, and testing is recommended by guidelines. In fact, when my leukemia group colleagues and I have done teaching or participated in advisory boards, we've noticed a degree of confusion.

Molecular Minimal Residual Disease in Acute Myeloid Leukemia

Patients with acute myeloid leukemia (AML) often reach complete remission, but relapse rates remain high. Next-generation sequencing enables the detection of molecular minimal residual disease in virtually every patient, but its clinical value for the prediction of relapse has yet to be established. **METHODS** We conducted a study involving patients 18 to 65 years of age who had newly diagnosed **Molecular Minimal Residual Disease Testing in Acute**

...
Minimal residual disease (MRD) testing in acute myeloid leukemia is increasingly being used to assess treatment response and stratify the risk of relapse for individual patients. Molecular methods for MRD testing began with PCR-based assays for individual recurrent mutations. To date, there is robust evidence for testing NPM1, CBFB-MYH11, and

Minimal Residual Disease in Acute Myeloid Leukemia. Monitoring measurable (minimal) residual disease (MRD) in acute myeloid leukemia (AML) has greatly increased our ability to assess chemosensitivity to treatment as well as the duration of treatment responses.

Acute Myeloid Leukemia Minimal Residual Disease Comes of Age

Acute myeloid leukemia (AML) is generally divided into prognostic subgroups based primarily on cytogenetic alterations, with further refinement based on a small group of molecular markers, and the presence of morphologically identifiable residual disease after treatment. 1 Half of AML cases in young adult patients fall into the standard-risk subgroup based on cytogenetic findings, with most

Molecular Minimal Residual Disease Monitoring in Acute ...

The ability to sensitively monitor minimal residual disease (MRD) has played a key role in improving the management and outcomes for a number of leukemias, particularly acute promyelocytic leukemia and childhood acute lymphoblastic leukemia. By contrast, MRD monitoring in acute myeloid leukemia (AML) has been limited by variable assay
