The success of Applied Scanning Probe Methods I XIII (published in the Springer Series Nanoscience and Technology) and the rapidly expanding activities in scanning probe development and applications worldwide make it a natural step to collect further specific results in the fields of development of scanning probe microscopy techniques, characterization, and industrial applications. Scanning Probe Microscopy in Nanoscience and Nanotechnology

The current volume Scanning Probe Methods in Nanoscience and Nanotechnology shows that these methods are still making a tremendous impact on many disciplines that range from fundamental physics. Nanoscience - Scanning Probe Microscopy Scanning Probe Microscopy (SPM) is a class of microscopes that use a physical probe to map the topography of a surface at nanoscale dimensions. In atomic force microscopy (AFM), a 1-10 m cantilever with an ultrasharp tip (< 10 nm radius) applies a small force to the surface.
