F.62 M. we tensor the spin bundles with E) and near Y we have where A_g is the generalized Dirac operator on Y . This identifies the elongated manifold X conformally with the punctured surface $X \setminus U$ pt. SINGER Suppose now is a hermitian vector bundle on X with a unitary connexion and that, defining a spinmanifold being now relaxed to allow $\sigma_2(X)$ to be the image of an integral cohomology

The real eigenfunctions ϕ_n and ψ_n have the form $\phi_n = L_n e^{-\gamma_n t}$ are the damping factors. Note that the first-order perturbation is strictly real and, as a result of complete damping, $\gamma_n > 0$. The zero-frequency eigenvalues are unaffected by damping as are their corresponding modes. The perturbations in the eigenfunctions have the form (30) where $\eta_n = \gamma_n$ and $\tau_n = \gamma_n$. As the system is

The interpretation of Aspect-type experiments is discussed in the light of the fact that some quantum states are, with respect to Bell's inequality, experimentally indistinguishable from a hidden-variable model.
