[Thermal contact conductance - Wikipedia](#)

In physics, thermal contact conductance is the study of heat conduction between solid bodies in thermal contact. The thermal contact conductance coefficient,  $\chi$ , is a property indicating the thermal conductivity, or ability to conduct heat, between two bodies in contact.

Thermal resistance (R) and thermal conductance (C) of the materials are reciprocals of one another and can be derived from thermal conductivity (k) and the thickness of the materials. The C-Therm TC) measures thermal conductivity and, therefore, paves the way to determine

thermal resistance and thermal conductance.

This means that thermal contact conductance is very high, and in the first four tests, the Detection Method will use contact at Gauss Point . All of these settings caused some irregularity in thermal flux perpendicular to the contact pair (in the X direction). Setting (1) above, Finer mesh on the insulator, contact side on the insulator, caused the least flux variation.
